## 28 Rhaan, 914 YK

Initial acquisition successful. Three specimens of \*Blink Dog secured from the North.

Creatures exhibit expected displacement behaviour—short-range planar shifting tied closely to heightened emotional states. Attempts at standard conditioning have failed. They do not respond as animals do. They have been kept in the kennel in cages and pinned to them arcanelly.

Initial observations:

They anticipate.

They choose.

A visiting consultant suggested an alternative approach:

“Do not train the instinct. Replace the decision that leads to it.”

We begin trials tomorrow.

## 19 Aryth, 915 YK

Breakthrough achieved.

Subject II accepted the imposed cognitive lattice.  
The displacement reflex has not been  
suppressed—but redirected. The creature no  
longer *chooses* to blink under stress.

It chooses to remain.

No distress observed. No resistance.

Compliance has been internalized.

The consultant's methods are... effective.  
Disturbingly so.

We are not reinforcing behaviour.

We are introducing **quieter thoughts** that  
displace louder ones.

I am no longer certain where instinct ends and  
imposition begins.

## **11 Barrakas, 917 YK**

Full integration confirmed in Subject III.

No spontaneous displacement. No deviation.  
Commands are followed before completion. The handler reports the creature appears to “know” what is required in advance.

This is not obedience.

This is **replaced**.

**A fail safe 3 word command phrase has been imprinted for emergency purposes.**

The consultant has proposed broader application—suggesting the method may function independent of original biology.

**“The vessel is secondary. The pattern is what matters.”**

Imagine a world where instincts can be unlearned and supplanted with more situational and desirable behaviours!
